

3. Technology Description

This project is a web-based mental health support system designed to help students improve their emotional well-being, track their moods, write journals, set goals, and interact with a simple chatbot for support. The system uses a relational database to securely store all the information and make it easy for students to record and monitor their daily emotional activities.

The platform is built using the Flask web framework. This framework connects the front end to the database and manages all user interactions. The database includes tables for students, mood entries, gratitude entries, journal entries, goals, exercise logs, and chatbot conversations. Students can create accounts, record their feelings, write gratitude notes, keep a personal journal, set goals, and log their exercises. The chatbot feature allows them to chat for motivation or support while keeping a record of conversations for future reference.

The system is designed to be user-friendly and secure, ensuring all student information is protected. It also supports future improvements, like adding more features or connecting to outside services for extra support.

- Web-based platform built with Flask for smooth backend operations.
- Relational database to store student information and related activities.
- Mood tracking feature to help students monitor their emotional well-being.
- Gratitude and journal entries to encourage positive reflection and self-expression.
- Goal-setting and tracking features to help students stay focused and motivated.
- Exercise logging to promote a balance between physical and mental health.
- Chatbot conversations to offer basic emotional support and motivation.
- Secure data handling to protect user information and privacy.
